

Charts

Charts are an optional Margo extension. The CLI registers the chart extension for you; Go applications opt in with `charts.Extension()`.

A chart fence

Static rendering produces an SVG and an adjacent semantic exact-data table. The table keeps the values available to readers and assistive technology even when JavaScript is disabled.

Go integration

```
compiler := margo.New(  
    margo.WithExtension(charts.Extension()),  
)
```

The extension supports `bar`, `line`, `pie`, `doughnut`, and `scatter` families. Static SVG remains the default. Set `renderer: interactive` when the host also wants Goshtoso chart controls; the accessible data table remains part of the

output contract.

Print behavior

Chart animation is disabled for deterministic capture. PDF output omits exact data tables by default; `--print-chart-data` includes them for a data-forward print artifact.
