

Presentation decks

The deck projection is a work in progress. It shares the Markdown compiler and metadata model with Margo's other outputs, but slide geometry, navigation, and end-to-end publication are not feature-complete yet. This page shows the intended output surface while the implementation is being finished.

Work in progress: use [PDF documents](#) for production paginated output while the deck pipeline is completed.

Intended output surface

```
# Experimental deck projection: HTML is the default.
margo deck talk.md --format html --output talk.html

# Experimental PDF deck projection.
margo deck talk.md --format pdf --output talk.pdf
```

Deck defaults are HTML, automatic installed-engine discovery, A4, portrait, and zero margins. PDF deck links use the same default relative-link policy as the document PDF command.

A focused projection

The deck renderer consumes the same Markdown compiler and metadata model, then adds slide geometry and presentation navigation. That keeps the authoring choice separate from the final delivery format:

Flowchart connecting Markdown source, Semantic render, "HTML deck (WIP)", and "PDF deck (WIP)".

Use PDF documents when the primary artifact is a paginated document. Treat the deck path as experimental until slide and publication support is complete.
