

Code fence

Ordinary fenced code blocks preserve source text and receive syntax highlighting when the language is known. The document shell adds a copy control; long inline code uses ellipsis with the full value available on hover.

Source

```
```go
document, err := compiler.Compile(ctx, source)
```
```

Result

```
document, err := compiler.Compile(ctx, source)
```

Options

Set the language tag (`go`, `sh`, `yaml`, and so on) to select highlighting. Omit it for plain text. Block fences receive copy controls; inline code keeps one line and uses ellipsis with the full value available on hover.
