

Fenced types

Margo keeps specialized Markdown blocks explicit. Each page documents the fence's source syntax and shows the resulting projection.

Built-in and optional fences

- Mermaid — diagrams rendered as sanitized SVG.
- Goshtoso charts — static SVG charts with accessible data.
- JSON Schema — versioned schema trees in documentation.
- Code blocks — highlighted source with copy controls.

Fences are parsed during compilation. Optional fences must be registered by the host, and a target can reject a fence when its projection is unsupported.
