

JSON Schema fence

The `jsonschema` fence validates an inline schema or a `ref=` path and renders its properties as an indented tree.

Source

```
```jsonschema
{
 "title": "Widget",
 "type": "object",
 "required": [
 "id"
],
 "properties": {
 "id": {
 "type": "string"
 },
 "labels": {
 "type": "array",
 "items": {
 "type": "string"
 }
 }
 }
}
```
```

Result

Widget

id *string* *

labels *array*

Options

Use an inline JSON object, `ref=path/to/schema.json`, or an embedded `ref=margo://schema/v1/...` contract. A `#/pointer` fragment selects a nested schema. The result is always a validated, indented property tree.
